

## UML Class Diagram (Attributes Only)

### Assumptions

- A student cannot have multiple credit cards associated with their account. If a credit card is not working/becomes obsolete, they should replace that information on their account.
- More than one student can possess the same credit card information, e.g., students from the same family.
- An administrator must not provide any other information because they are pre-registered.

### Design Decisions

- In the first deliverable, Tutors and Students are identified as related. However, associated attributes and methods are left out as they are yet to be implemented.
